

**Abstract**

A handheld mobile communications device includes a support structure. An antenna is mounted on the support structure for transmitting and receiving radio signals. Radio signal processing circuitry is positioned on the support structure to process the radio signals. A speaker and microphone arrangement is positioned on the support structure and operatively connected to the radio signal processing circuitry. A printhead is positioned on the support structure to carry out a printing operation. Printing processing circuitry is positioned on the support structure to control operation of the printhead.
